Thema

Energy-Efficient Retrieval Strategies in Robotic Compact Storage Systems with Side Access

Kurzbeschreibung

This thesis will explore the operational efficiency of robotic compact storage systems (RCSS) with side-access retrieval, aiming to minimize energy consumption during the order retrieval process. It will examine different retrieval strategies, formulate mathematical models, and develop algorithms to optimize the sequence of retrieving stock-keeping units (SKUs), considering constraints imposed by compact storage configurations.

Objectives:

1. Define formal optimization models for retrieval operations in side-access compact storage systems.
2. Evaluate algorithmic strategies (heuristics, dynamic programming) for minimizing energy use.
3. Conduct computational experiments to assess algorithmic performance and practical applicability.
4. Provide managerial insights into optimal retrieval practices in compact storage contexts.
